RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 312 pages. Dimensions: 9.7in. x 7.4in. x 0.7in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1912 Excerpt: . . . for use in general testing work. Several other investigations have been undertaken in connection with the development of new lines of electrical instruments, and with improvements in existing types. Upon the renewal of the contracts for supplying light and power to the departments, the Bureau was requested by the various departments, at the suggestion of the Secretary of the Treasury, to test the electric meters measuring the power supplied to the various Government buildings in the District of Columbia. The tests made during the year included 27 ammeters, 20 voltmeters, 17 wattmeters, 94 watt-hour meters, 3 power-factor meters, 15 current transformers, 20 insulation tests with high voltage, 2 arc lamps, 33 electric fans, 19 dry cells, and 4 miscellaneous tests--a total of 209 pieces. ELECTRICAL RESISTIVITY OF COPPER. The results of the investigation to determine the electrical conductivity and temperature coefficient of average commercial high-grade copper were published during the year. A reasonable agreement was found for samples from different sources, and satisfactory average values were obtained. The measurements were made with an unusually high accuracy, which was made possible by a specially designed and constructed apparatus. It was discovered that the temperature coefficient and conductivity are substantially proportional. This relation has been corroborated by work done at the Reichsanstalt, of Germany, and has a number of useful consequences. It was also found that bending and winding do not change the temperature coefficient, and consequently the internal temperature of dynamos and instruments may be calculated from...
